GoLab MVP — Development Proposal

Date: 27 March 2026

What You Get

A working MVP of the GoLab portal implementing the workflow described in your four scoping documents (Brief Document, Business Requirements, Sample Testing SOP, and Flowchart), deployed to a single environment on AWS for you to thoroughly test and evaluate.

The goal is for you to test it extensively, confirm the workflow works for your business, and then decide whether to continue with me or hand it to another developer to take it further.

Agreement Summary

MVP	$6,000 USD
Post-handover support (optional, up to 6 months)	$350 / month

MVP — $6,000

Delivered as a single deployment on AWS for testing and evaluation. Covers:

- Customer registration, login, profile management
- Credit application and approval workflow
- COD payment flow with Stripe (payment links, confirmation gate)
- Test catalogue with accredited/non-accredited status
- Quote request, review, acceptance
- Invoice generation on acceptance
- Lab selection logic (closest lab, multi-lab split)
- Lab portal: sample acceptance, issue logging, turnaround updates, result upload
- GoLab review and approval workflow (approve, hold, return to lab)
- Certificate validation against request/test reference
- Customer release with options (accept, callback, retest, send to another lab)
- Customer dashboard: request history, statuses, certificate repository, financials
- Unique reference structure across all entities
- Tolerance capture (profile-level defaults + per-request overrides)
- Customer and laboratory disclaimers (versioned, auditable)
- Email notifications at all key workflow stages
- WhatsApp notifications (via Twilio)
- KPI dashboard and management reporting
- Exception workflow with status tracking, assignment, and audit trail
- Branded certificate PDF generation (GoLab format)
- Full audit trail across all entities
- Role-based access (Customer, Lab, GoLab Admin, Finance)
- Single-environment deployment with SSL
- User documentation / walkthrough

Moving to a full production setup (separate dev/staging/production environments, automated backups, monitoring, scaling) would be part of a follow-on engagement if you decide to proceed.

Post-Handover Support — $350/month (up to 6 months)

Optional. Starts after MVP handover if you choose to continue. Can be cancelled at any time — upon cancellation, hosting is shut down and no further costs are incurred.

Covers:

- AWS hosting (compute, database, storage, email)
- Bug fixes for issues found during testing and usage
- Minor adjustments (field changes, status labels, notification wording)

Does **not** cover new features, new integrations, or scope changes — those would be quoted separately.

Intellectual Property & Source Code

All source code, documentation, and related assets developed under this agreement are transferred in full to the client upon completion of each milestone payment.

- Upon final payment: complete and unrestricted ownership of all IP, source code, infrastructure configuration, and documentation
- If either party decides not to continue the engagement at any point, all work completed up to that point (and paid for) is handed over — including source code, database schemas, deployment configurations, and any related assets
- The client is free to engage any other developer or team to continue the project using the delivered codebase

---

What's Fully Included vs. What Depends on External Factors

Fully included — no dependencies

Area	Detail
Payments	Stripe integration — payment links, confirmation, invoicing. Works globally including ZAR.
Email notifications	All 19 notification triggers from the SOP, via Resend or AWS SES.
WhatsApp notifications	Via Twilio WhatsApp API.
Authentication	Email/password login. Role-based access.
Database & storage	PostgreSQL, S3 for certificates/documents.
PDF generation	Branded certificates, request forms, invoices.
Deployment	Single environment on AWS with SSL.

Depends on you providing information

Area	What I need	Fallback if not provided
Test catalogue	List of real tests, accreditation status, pricing	I'll build the admin UI to manage tests, but ship with placeholder data
Lab directory	Lab names, locations, test capabilities	Same — admin UI ready, placeholder data
Certificate template	A sample certificate to replicate	Generic GoLab-branded template, refined once you provide a sample
Tolerances	Example of what a real tolerance looks like	Flexible numeric field that can be adjusted once format is confirmed

Requires a third-party API — transparent limitations

Area	Situation	What I deliver
Courier integration	The documents reference a courier API but don't name the provider. I can't build a real integration without their API documentation.	A **courier integration module** with: manual waybill upload, status tracking in the portal, and notification triggers. The moment you confirm which courier and provide API access, I plug it in. The workflow is fully functional — just the pickup trigger and auto-waybill are manual until then.

This is the one area where the system won't be fully automated without the courier API. Everything else is functional.

Tech Stack

Layer	Technology
Frontend	Next.js (React)
Backend / API	Next.js API routes
Database	PostgreSQL (AWS RDS)
File storage	AWS S3
Authentication	NextAuth.js v5
Payments	Stripe
Email	AWS SES or Resend
WhatsApp	Twilio
PDF generation	React-PDF or Puppeteer
Hosting	AWS (ECS or App Runner)
Monitoring	CloudWatch + structured logging

Timeline

When	Deliverable
Mid May	First cut — core workflow available for initial review and feedback
Mid May – Early June	3 weeks of testing, feedback, and adjustments
Early June	MVP complete — $6,000 payment due. At this point you can either conclude the engagement or transition into post-handover support.

What's NOT Included

- Mobile app (the portal is responsive/mobile-friendly, but no native app)
- AI/RAG chat support
- Courier API integration (until courier is confirmed and API access provided)
- Migration from any existing system
- Custom domain and DNS setup (happy to advise)
- Ongoing feature development beyond bug fixes

Any of these can be added as a separate scope.
